AS5215

Programmable 360° Magnetic Angle Encoder with Buffered SINE & COSINE Output Signals

1 General Description

The AS5215 is a redundant, contactless rotary encoder sensor for accurate angular measurement over a full turn of 360° and over an extended ambient temperature range of -40°C to +150°C.

Based on an integrated Hall element array, the angular position of a simple two-pole magnet is translated into analog output voltages. The angle information is provided by means of buffered sine and cosine voltages. This approach gives maximum flexibility in system design, as it can be directly integrated into existing architectures and optimized for various applications in terms of speed and accuracy.

With two independent dies in one package, the device offers true redundancy. Usually the bottom die, which is exposed to slightly less magnetic field is employed for plausibility check.

An SSI Interface is implemented for signal path configuration as well as a one time programmable register block (OTP), which allows the customer to adjust the signal path gain to adjust for different mechanical constraints and magnetic field.

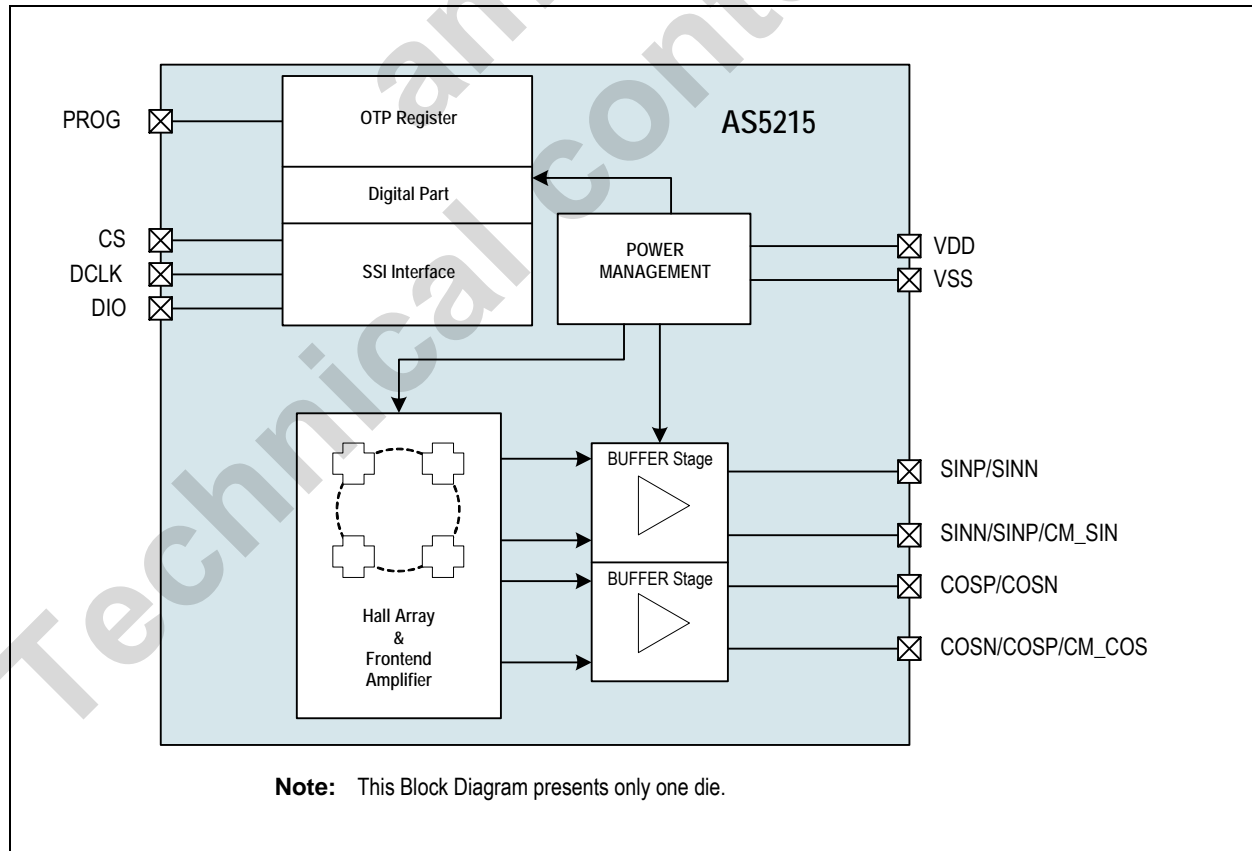

2 Key Features

- Contactless angular position encoding
- High precision analog output
- Buffered Sine and Cosine signals
- SSI Interface
- Low power mode
- Two programmable output modes: Differential or Single ended
- Wide magnetic field input range: 20 – 80 mT
- Wide temperature range: -40°C to +150°C
- Fully automotive qualified to AEC-Q100, grade 0
- Thin punched 32-pin QFN (7x7mm) package

3 Applications

The AS5215 is ideal for Electronic Power Steering systems and general purpose for automotive or industrial applications in microcontroller-based systems.

5 Absolute Maximum Ratings

Stresses beyond those listed in [Table 2](#) may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in [Electrical Characteristics on page 6](#) is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 2. Absolute Maximum Ratings

Parameter	Min	Max	Units	Comments
Electrical Parameters				
Supply voltage (V _{DD})	-0.3	7	V

t10_3	Bus floating time Negative edge of chip select to float bus		-		30	ns
t11	Setup time data bit at write access Data valid to positive edge of DCLK		30		-	ns
t12	Hold time data bit at write access Data valid after positive edge of DCLK		15		-	ns
t13_3	Bus floating time Negative edge of chip select to float bus		-		30	ns

Remark: The digital interface will be reset during the low phase of the CS signal.

7 Detailed Description

The AS5215 is a redundant rotary encoder sensor front end. Based on an integrated Hall element array, the angular position of a simple two-pole magnet is translated into analog output voltages. The angle information is provided by means of sine and cosine voltages. This approach gives maximum flexibility in system design, as it can be directly integrated into existing architectures and optimized for various applications in terms of speed and accuracy.

With two independent dies in one package, the device offers true redundancy. Usually the bottom die, which is exposed to slightly less magnetic field is employed for plausibility check.

An SSI (SPI standard) protocol is implemented for internal test access to the different circuit blocks and for signal path configuration.

A One Time Programmable register block (OTP) allows the customer to adjust the signal path gain to adjust for different mechanical constraints and magnetic field strengths. Furthermore, for internal use, the test mode can be enabled and the system oscillator is trimmable, DC offset of the output signal can be set to either 1.5V or 2.5V. A unique chip ID is stored to ensure traceability.

For operating point control, a band gap circuit is implemented together with a central bias block to distribute all reference bias currents for the analog signal conditioning. The digital signal part is based on a 2MHz system, CLK derived via divider from a 4MHz system oscillator.

Figure 3. Typical Arrangement of AS5215 and Magnet

7.1 Magnet Diameter and Vertical Distance

Note: Following is just an abstract taken from the elaborate application note on the Magnet.

For more detailed information, please visit our homepage www.austriamicrosystems.com → [Magnetic Rotary Encoders](#) → Magnet Application Notes

7.1.1 The Linear Range

The Hall elements used in the AS5000-series sensor ICs are sensitive to the magnetic field component B_z , which is the magnetic field vertical to the chip surface. [Figure 4](#) shows a 3-dimensional graph of the B_z field across the surface of a 6mm diameter, cylindrical NdFeB N35H magnet at an axial distance of 1mm between magnet and IC.

The highest magnetic field occurs at the north and south poles, which are located close to the edge of the magnet, at ~ 2.8 mm radius (see [Figure 5](#)). Following the poles towards the center of the magnet, the B_z field decreases very linearly within a radius of ~ 1.6 mm. This linear range is the operating range of the magnet with respect to the Hall sensor array on the chip. For best performance, the Hall elements should always be within this linear range.

Figure 4. 3D-Graph of Vertical Magnetic Field of a 6mm Cylindrical Magnet

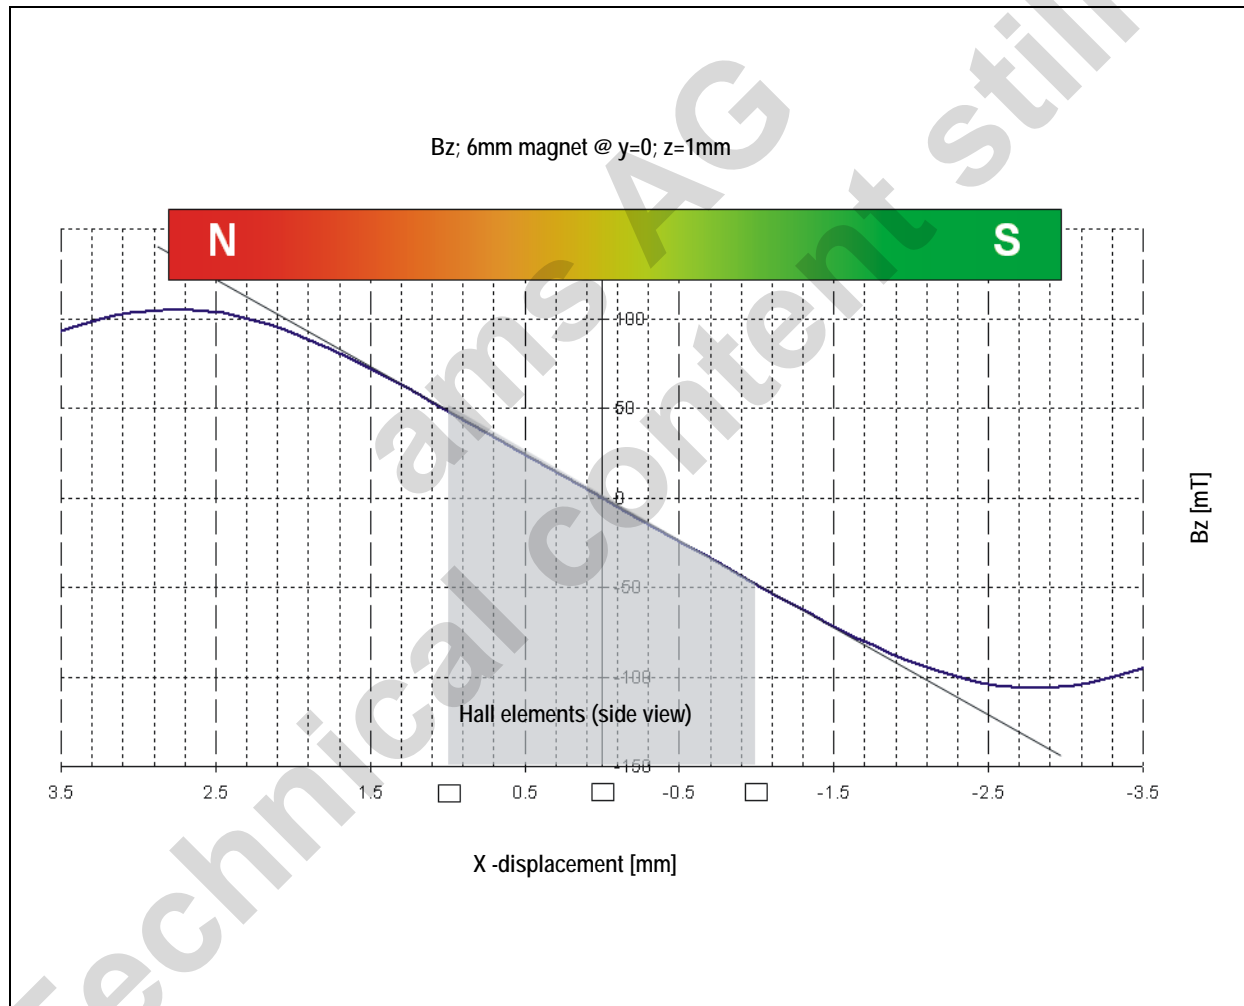

As shown in Figure 5 (grey zone), the Hall elements are located on the chip at a circle with a radius of 1mm. Since the difference between two opposite Hall sensors is measured, there will be no difference in signal amplitude when the magnet is perfectly centered or if the magnet is misaligned in any direction as long as all Hall elements stay within the linear range.

For the 6mm magnet (shown in Figure 5), the linear range has a radius of 1.6mm, hence this magnet allows a radial misalignment of 0.5mm (1.6mm linear range radius; 1mm Hall array radius). Consequently, the larger the linear range, the more radial misalignment can be tolerated. By contrast, the slope of the linear range decreases with increasing magnet diameter, as the poles are further apart. A smaller slope results in a smaller differential signal, which means that the magnet must be moved closer to the IC (smaller airgap) or the amplification gain must be increased, which leads to a poorer signal-to-noise ratio. More noise results in more jitter at the angle output. A good compromise is a magnet diameter in the range of 5...8mm.

Small Diameter Magnet (<6mm)	Large Diameter Magnet (>6mm)
+ stronger differential signal = good signal / noise ratio, larger airgaps	+ wider linear range = larger horizontal misalignment area
- shorter linear range = smaller horizontal misalignment area	- weaker differential signal = poorer signal / noise ratio, smaller airgaps

Figure 5. Vertical Magnetic Field Across the Center of a Cylindrical Magnet

7.1.2 Magnet Thickness

Figure 6 shows the relationship of the peak amplitude in a rotating system (essentially the magnetic field strength of the Bz field component) in relation to the thickness of the magnet. The X-axis shows the ratio of magnet thickness (or height) [h] to magnet diameter [d] and the Y-axis shows the relative peak amplitude with reference to the recommended magnet (d=6mm, h=2.5mm). This results in an h/d ratio of 0.42.

Figure 6. Relationship of Peak Amplitude vs. Magnet Thickness

As the graph in Figure 6 shows, the amplitude drops significantly at h/d ratios below this value and remains relatively flat at ratios above 1.3.

Therefore, the recommended thickness of 2.5mm (at 6mm diameter) should be considered as the low limit with regards to magnet thickness.

It is possible to get 40% or more signal amplitude by using thicker magnets. However, the gain in signal amplitude becomes less significant for h/d ratios >~1.3. Therefore, the recommended magnet thickness for a 6mm diameter magnet is between 2.5 and ~8 mm.

7.1.3 Axial Distance (Airgap)

Figure 7. Sinusoidal Magnetic Field Generated by the Rotating Magnet

The recommended magnetic field, measured at the chip surface on a radius equal to the Hall sensor array radius (typ 1mm) should be within a certain range. This range lies between 45 and 75mT or between 20 and 80mT, depending on the encoder product.

Linear position sensors are more sensitive as they use weaker magnets. The allowed magnetic range lies typically between 5 and 60mT.

7.1.4 Angle Error vs. Radial and Axial Misalignment

The angle error is the deviation of the actual angle vs. the angle measured by the encoder. There are several factors in the chip itself that contribute to this error, mainly offset and gain matching of the amplifiers in the analog signal path. On the other hand, there is the nonlinearity of the signals coming from the Hall sensors, caused by misalignment of the magnet and imperfections in the magnetic material.

Ideally, the Hall sensor signals should be sinusoidal, with equal peak amplitude of each signal. This can be maintained, as long as all Hall elements are within the linear range of the magnetic field B_z (see Figure 5).

7.1.5 Mounting the Magnet

Generally, for on-axis rotation angle measurement, the magnet must be mounted centered over the IC package. However, the material of the shaft into which the magnet is mounted, is also of big importance.

Magnetic materials in the vicinity of the magnet will distort or weaken the magnetic field being picked up by the Hall elements and cause additional errors in the angular output of the sensor.

Figure 8. Magnetic Field Lines in Air

Figure 8 shows the ideal case with the magnet in air. No magnetic materials are anywhere nearby.

Figure 9. Magnetic Field Lines in Plastic or Copper Shaft

If the magnet is mounted in non-magnetic material, such as plastic or diamagnetic material, such as copper, the magnetic field distribution is not disturbed. Even paramagnetic material, such as aluminium may be used. The magnet may be mounted directly in the shaft (see Figure 9).

Note: Stainless steel may also be used, but some grades are magnetic. Therefore, steel with magnetic grades should be avoided.

Figure 10. Magnetic Field Lines in Iron Shaft

If the magnet is mounted in a ferromagnetic material, such as iron, most of the field lines are attracted by the iron and flow inside the metal shaft (see Figure 10). The magnet is weakened substantially.

This configuration should be avoided!

Figure 11. Magnetic Field Lines with Spacer Between Magnet and Iron Shaft

If the magnet has to be mounted inside a magnetic shaft, a possible solution is to place a non-magnetic spacer between shaft and magnet, as shown in Figure 11. While the magnetic field is rather distorted towards the shaft, there are still adequate field lines available towards the sensor IC. The distortion remains reasonably low.

7.1.6 Summary

- Small diameter magnets (<6mm Ø) have a shorter linear range and allow less lateral misalignment. The steeper slope allows larger axial distances.
- Large diameter magnets (>6 mm Ø) have a wider linear range and allow a wider lateral misalignment. The flatter slope requires shorter axial distances.
- The linear range decreases with airgap; Best performance is achieved at shorter airgaps.
- The ideal vertical distance range can be determined by using magnetic range indicators provided by the encoder ICs. These indicators are named MagInc, MagDec, MagRngn, or similar, depending on product.

8 Application Information

8.1 Sleep Mode

The target is to provide the possibility to reduce the total current consumption. No output signal will be provided when the IC is in sleep mode. Enabling or disabling sleep mode is done by sending the SLEEP or WAKEUP commands via the SSI interface. Analog blocks are powered down with respect to fast wake up time.

8.2 SSI Interface

The setup for the device is handled by the digital interface. Each communication starts with the rising edge of the chip select signal. The synchronization between the internal free running analog clock oscillator and the external used digital clock source for the digital interface is done in a way that the digital clock frequency can vary in a wide range.

Table 8. SSI Interface Pin Description

Port	Symbol	Function
Chip select	CS	Indicates the start of a new access cycle to the device CS = LO → reset of the digital interface
DCLK	DCLK	Clock source for the communication over the digital interface
Bidirectional data input output	DIO	Command and data information over one single line The first bit of the command defines a read or write access

Table 9. SSI Interface Parameter Description

Symbol	Parameter	Notes	Min	Typ	Max	Unit
f_DCLK	Clock frequency at normal operation	The nominal value for the clock frequency can be derived from a 10MHz oscillator source.	no limit	5	6	MHz
f_EZ_RW	Clock frequency at easy zap read write access		no limit	5	6	kHz
f_EZ_PR OG	Clock frequency at easy zap access program OTP	Correct access to the programmable zener diode block needs a strict timing – the zap pulse is exact one period. The nominal value for the clock frequency can be derived from a 10MHz oscillator source.	200	-	650	kHz
f_EZ_AR B	Clock frequency at easy zap analog readback	20pF external load allowed. The nominal value for the clock frequency can be derived from a 10MHz oscillator source.	no limit	156.3	162.5	kHz
Interface General at normal mode						
Protocol: 5 command bit + 16 data input output

9	RD_OTP_ANA	01001	xt read														

Remark:

1. Send EN PROG (command 16) in normal mode before accessing the OTP in extended mode.
2. OTP assignment will be defined/updated.

Name	Functionality
Otp_test	Dummy fuse bit used in production test
ID	Part identification
n.c.	Not connected
10 μ biastrim	10 μ bias current trim bits
vref	Bias Block reference voltage trim bits
osc	Oscillator trimming bits
lock_OTP	To disable the programming of the factory bits <45...14>
invert_channel	Inverts SIN and COS channel before the PGA for inverted output function (0...SIN/COS, 1...SINN/COSN)
cm_sin	Common mode voltage output enabled at SINN / CM pin (0...differential, 1...common)
cm_cos	Common mode voltage output enabled at COSN / CM pin (0...differential, 1...common)
gain	PGA gain setting (influences overall magnetic sensitivity), 2bit
dc_offset	Output DC offset (0...1.5V, 1...2.5V)
Hall_b	Hall bias setting (influences overall magnetic sensitivity), 6bit

Figure 12. Sensitivity Gain Settings - Relative Sensitivity in %

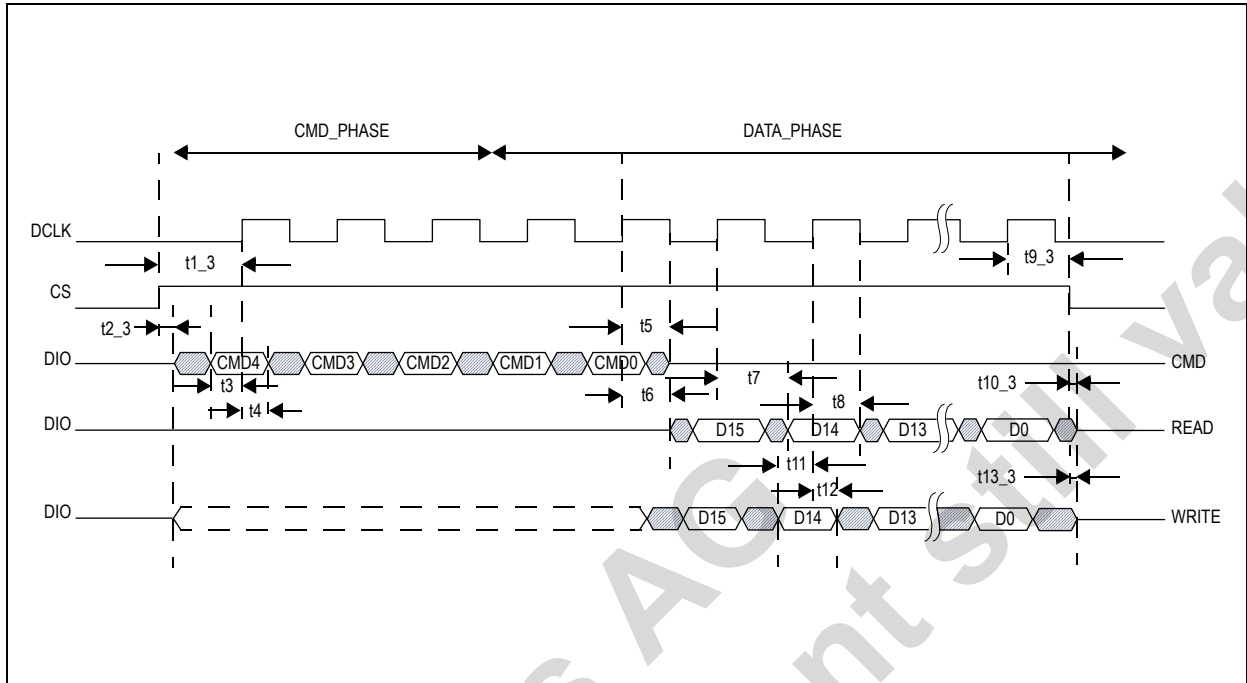

The amplitude of the output signal is programmable via sensitivity (6bit) and/or gain (2bit) settings (see Figure 12).

Figure 13. Sensitivity Gain Settings - Sensitivity [mV/mT]

8.4 Waveform – Digital Interface at Normal Operation Mode

Figure 14. Digital Interface at Normal Operation Mode

8.5 Waveform – Digital Interface at Extended Mode

In the extended mode, the digital interface needs four clocks for one data bit. During this time, the device is able to handle internal signals for special access (e.g. the easy zap interface).

Figure 15. Digital Interface at Extended Mode

8.6 Waveform – Digital Interface at Analog Readback of the Zener Diodes

To be sure that all Zener-Diodes are correctly burned, an analog readback mechanism is defined. Perform the 'READ OTP ANA' sequence according to the command table and measure the value of the diode at the end of each phase.

Figure 16. Digital Interface at Analog Readback of Zener Diodes

Table 12. Serial Bit Sequence (16-bit read / write)

Write Command					Read / Write Data															
C4	C3	C2	C1	C0	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

8.7 EasyZapp OTP Content

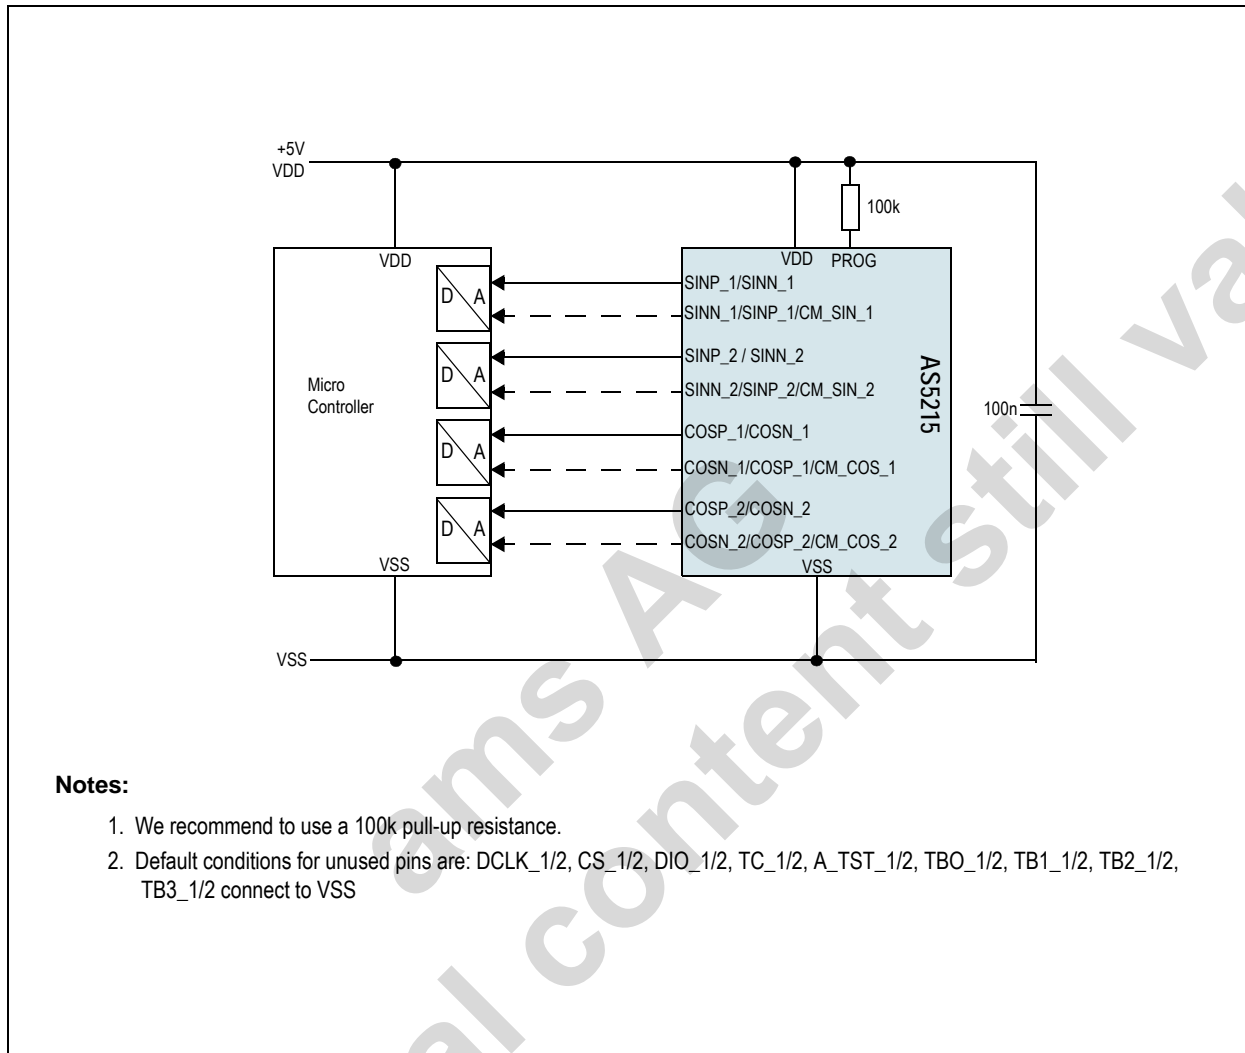

Each AS5215 die has an integrated 32-bit OTP ROM (EasyZapp) for trimming and configuration purposes. The PROM can be programmed via the serial interface. For irreversible programming, an external programming voltage at PROG pin is needed. For security reasons, the factory trim bits can be locked by a lock bit.

Name	Bit Count	OTP Start	OTP End	Access	Comments
Hall Bias	6	0	5	user	Sets overall sensitivity
DC offset	1	6	6	user	Output DC offset setting
gain	2	7	8	user	Programmable gain amplifier setting
Lock	1	13	13	austriamicrosystems	Set in production test
invert_channel	1	11	11	user	Inverts SIN and COS channel before the PGA for inverted output function
cm_sin	1	10	10	user	Common mode voltage output enabled at SINN / CM pin
cm_cos	1	9	9	user	Common mode voltage output enabled at COSN / CM pin

Remark: OTP assignment will be defined/updated.

8.8 Analog Sin/Cos Outputs with External Interpolator

Figure 17. Sine and Cosine Outputs for External Angle Calculation

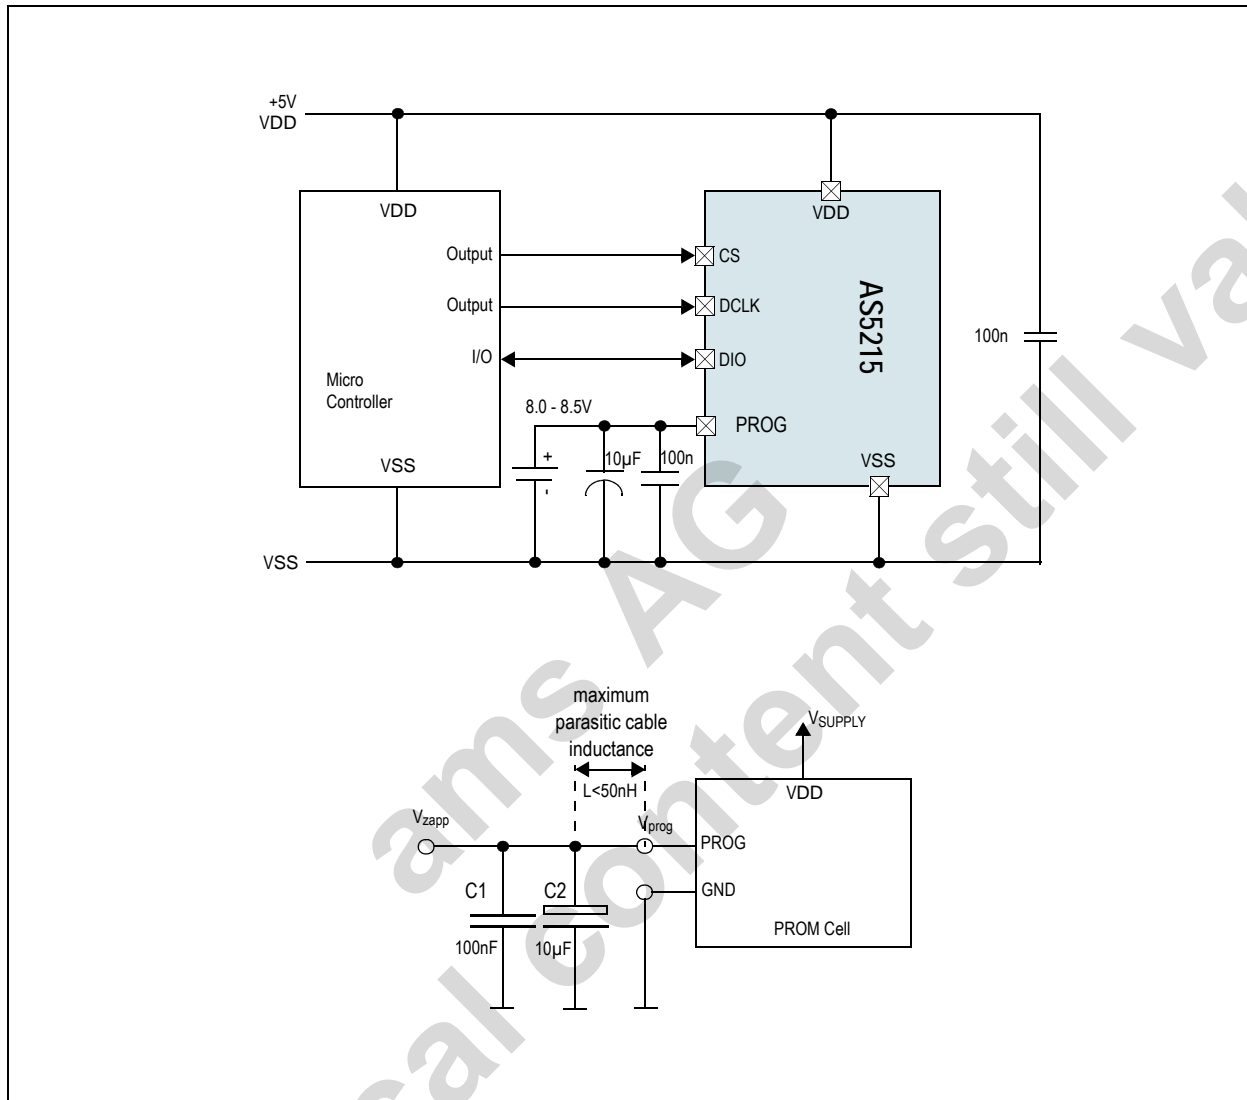

The AS5215 provides analog Sine and Cosine outputs (SINP, COSP) of the Hall array front-end for test purposes. These outputs allow the user to perform the angle calculation by an external ADC + μ C, e.g. to compute the angle with a high resolution. The output driver capability is 1mA. The signal lines should be kept as short as possible, longer lines should be shielded in order to achieve best noise performance.

Through the programming of one bit, you have the possibility to choose between the analog Sine and Cosine outputs (SINP, COSP) and their inverted signals (SINN, COSN). Furthermore, by programming the bits <9:10> you can enable the common mode output signals of SIN and COS.

The DC bias voltage is 1.5 or 2.5 V.

8.9 OTP Programming and Verification

Figure 18. OTP Programming Connection

For programming of the OTP, an additional voltage has to be applied to the pin PROG. It has to be buffered by a fast 100nF capacitor (ceramic) and a 10µF capacitor. The information to be programmed is set by command 25. The OTP bits 16 until 45 are used for AMS factory trimming and cannot be overwritten.

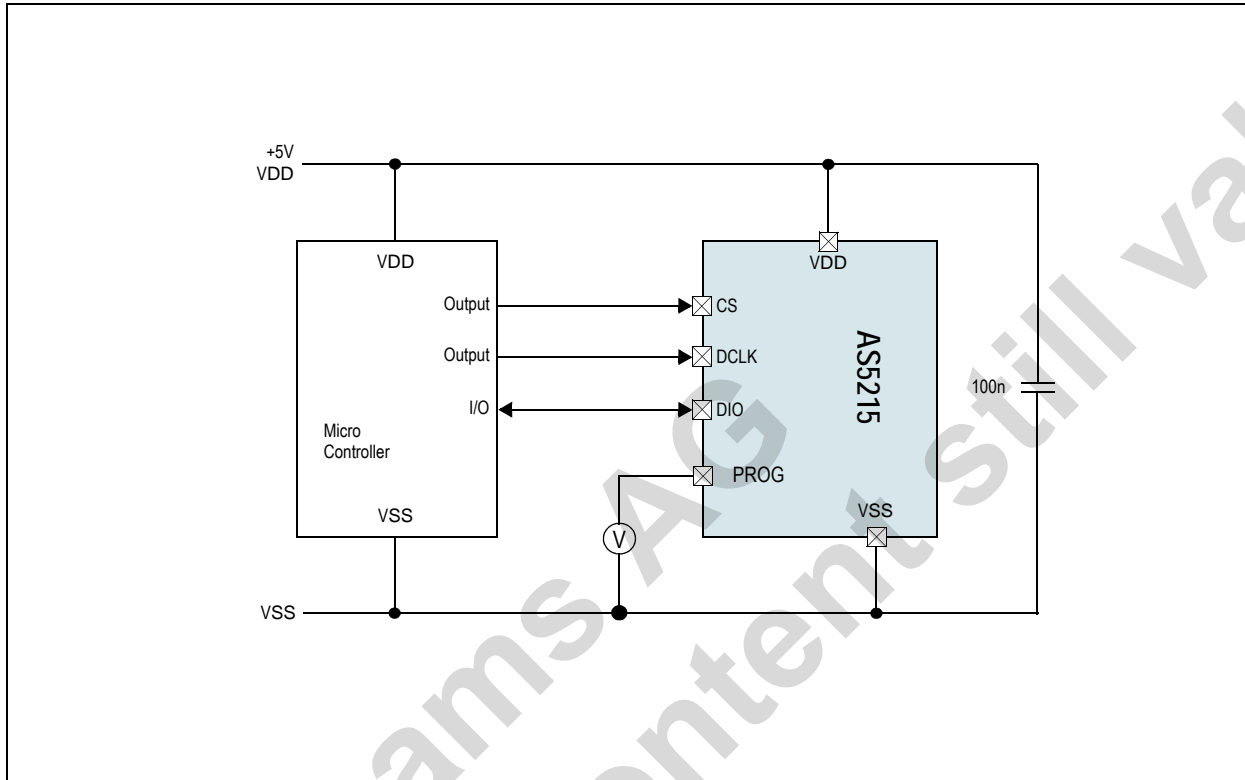

Symbol	Parameter	Min	Max	Unit	Note
VDD	Supply Voltage	5	5.5	V	
GND	Ground level	0	0	V	
V_zapp	Programming Voltage	8	8.5	V	At pin PROG
T_zapp	Temperature	0	85	°C	
f_clk	CLK Frequency		100	kHz	At pin DCLK

After programming, the programmed OTP bits must be verified in two ways:

By Digital Verification: This is simply done by sending a READ OTP command (#15). The structure of this register is the same as for the OTP PROG or OTP WRITE commands.

By Analog Verification: By switching into Extended Mode and sending an ANALOG OTP READ command (#9), pin PROG becomes an output, sending an analog voltage with each clock representing a sequence of the bits in the OTP register (starting with D45). A voltage of <math><500\text{mV}</math> indicates a correctly programmed bit ("1") while a voltage level between 2V and 3.5V indicates a correctly unprogrammed bit ("0"). Any voltage level in between indicates incorrect programming.

Figure 19. Analog OTP Verification

9 Package Drawings and Markings

The devices are available in a 32-pin QFN (7x7mm) package.

Figure 20. Package Drawings and Dimensions

Notes:

1. Dimensions and tolerancing conform to ASME Y14.5M-1994.
2. All dimensions are in millimeters. Angles are in degrees.
3. Bilateral coplanarity zone applies to the exposed pad as well as the terminal.
4. Radius on terminal is optional.
5. N is the total number of terminals.

1.0	April 29, 2008	apg	Initial revision
	July 03, 2008		Redundancy Coding topic deleted.
1.1	July 15, 2008		Updated Key Features, Table 1 - Pin Descriptions, Figure 1 and Figure 17 .
1.2	July 14, 2009		Updated min, typ, max values for 'Power up time' parameter in Table 6 .
1.3	July 31, 2009		Updated the following parameters in Table 6 : <ul style="list-style-type: none"> - Values and conditions updated for <ol style="list-style-type: none"> 1. Propagation delay 2. Amplitude ratio tracking accuracy over temperature 3. DC Offset Drift - Deleted the 'Output Offset' parameter from the table.
	Aug 24, 2009		Updated following bits related information on page 16 - invert_channel, cm_sin, cm_cos, gain, dc_offset, Hall_b
1.4	Aug 26, 2009		Inserted Figure 12 and updated Applications and Figure 17 .
1.5	Sept 01, 2009		Inserted Figure 13 , Added a note in Revision History.
1.6	Sept 02, 2009		Deleted 'Displacement' parameter from Table 5 .
1.7	Nov 26, 2009		Hall Array Radius value updated from 1.1mm to 1mm Updated Figure 13
1.8	Dec 11, 2009		Updated values for 'Magnetic Sensitivity' parameter in Table 6 .
	Dec 15, 2009	Ordering code updated.	
1.9	Jan 27, 2010	Updated 'Interface General at extended mode' (see Table 9)	
	Feb 10, 2010	Updated values for 'Power up time' parameter in Table 6 .	
	Mar 19, 2010	Added 'Current Consumption' parameter in Table 6 .	
1.10	Sep 06, 2010	Updated Package Drawings and Markings (page 23) and Ordering Information (page 25).	
1.11	Jun 27, 2011	mub Updated Absolute Maximum Ratings (page 5), Table 4 , OTP Programming and Verification (page 21), Package Drawings and Markings (page 23).	

Note: Typos may not be explicitly mentioned under revision history.

10 Ordering Information

The devices are available as the standard products shown in [Table 13](#).

Table 13. Ordering Information

Ordering Code	Description	Delivery Form	Package
AS5215OM-HMFP, -HMFM	Sine and cosine analog output magnetic rotary encoder	Tape & Reel	32-pin QFN (7x7mm)

Note: All products are RoHS compliant and austriamicrosystems green.
Buy our products or get free samples online at ICdirect: <http://www.austriamicrosystems.com/ICdirect>

Technical Support is available at <http://www.austriamicrosystems.com/Technical-Support>

Disclaimer

Devices sold by austriamicrosystems AG are covered by the warranty and patent indemnification provisions appearing in its Term of Sale. austriamicrosystems AG makes no warranty, express, statutory, implied, or by description regarding the information set forth herein or regarding the freedom of the described devices from patent infringement. austriamicrosystems AG reserves the right to change specifications and prices at any time and without notice. Therefore, prior to designing this product into a system, it is necessary to check with austriamicrosystems AG for current information. This product is intended for use in normal commercial applications. Applications requiring extended temperature range, unusual environmental requirements, or high reliability applications, such as military, medical life-support or life-sustaining equipment are specifically not recommended without additional processing by austriamicrosystems AG for each application. For shipments of less than 100 parts the manufacturing flow might show deviations from the standard production flow, such as test flow or test location.

The information furnished here by austriamicrosystems AG is believed to be correct and accurate. However, austriamicrosystems AG shall not be liable to recipient or any third party for any damages, including but not limited to personal injury, property damage, loss of profits, loss of use, interruption of business or indirect, special, incidental or consequential damages, of any kind, in connection with or arising out of the furnishing, performance or use of the technical data herein. No obligation or liability to recipient or any third party shall arise or flow out of austriamicrosystems AG rendering of technical or other services.
