Product Description

DFB01 and PFB01 are precise frequency monitoring relays. The relays monitor their own power supply from 24 to 240 VAC.

The advantage of using the latch function is that the relay can be kept energized

even after the end of the alarm condition. Inhibit function can be used to avoid relay operation when not desired (maintenance, transitions). The LED's indicate the state of the alarm and the output relay.

Mode of Operation

DFB01 and PFB01 monitor the frequency value of their own power supply.

Example 1

(Non-latching mode - N.D. relay)

The relay operates and the yellow LED is ON as soon as the measured frequency exceeds the upper set level or drops below the lower set level for more than the set delay time. The relay releases when the measured frequency comes back within the upper and lower limits. The red LED flashes until the delay time has expired or the measured value falls off the limits.

Example 2

(Latching mode - N.E. relay)

The relay operates and the yellow LED is ON as long as the measured frequency is within the upper and lower limits.

The relay releases and latches in alarm position as soon as the measured frequency exceeds the upper set level or drops below the lower set level for more than the set delay time. The red LED flashes until the delay time has expired or the measured value comes back within the limits. Provided that the frequency has dropped below the upper set level (minus hysteresis) or exceeded the lower set level (plus hysteresis), the relay operates when the interconnections between terminals Z1, Z2 or 8, 9 are interrupted.
